LAB 6 : VM Recovery Using Snapshot

STEPS:

1. Create an **Azure Linux VM**
2. Take a **snapshot of the OS disk**
3. Simulate **OS disk corruption**
4. **Recover** by creating a new OS disk from the snapshot
5. **Swap the OS disk** to restore the VM

After creatin an resource group

Basics Tags Review + create

Resource group - A container that holds related resources for an Azure solution. The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. You decide how you want to allocate resources to resource groups based on what makes the most sense for your organization. Learn more

Create a resource group ...

Basics Tags **Review + create**

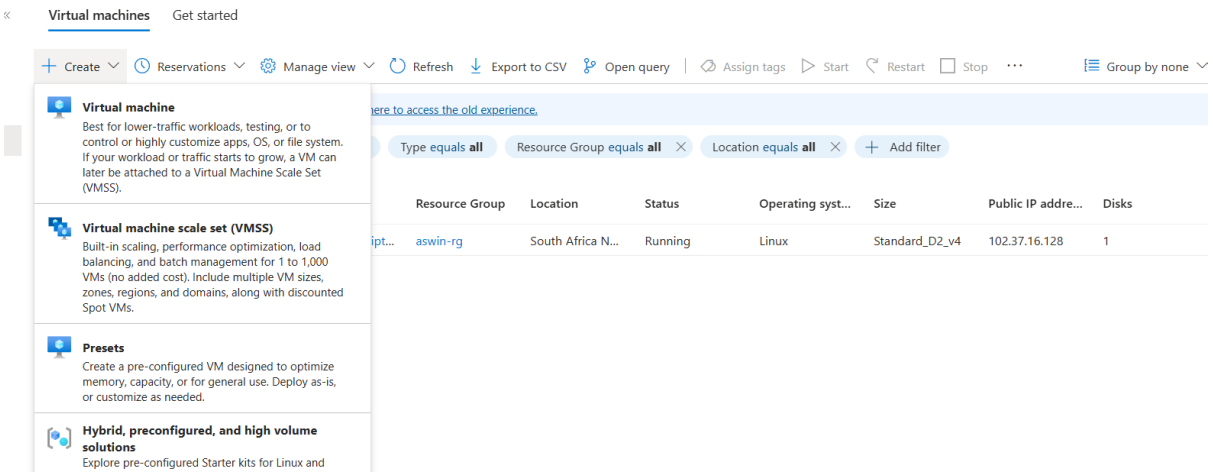

Automation Link

Basics

Subscription	Azure subscription 1
Resource group name	dhanush-rg
Region	Australia East

Tags

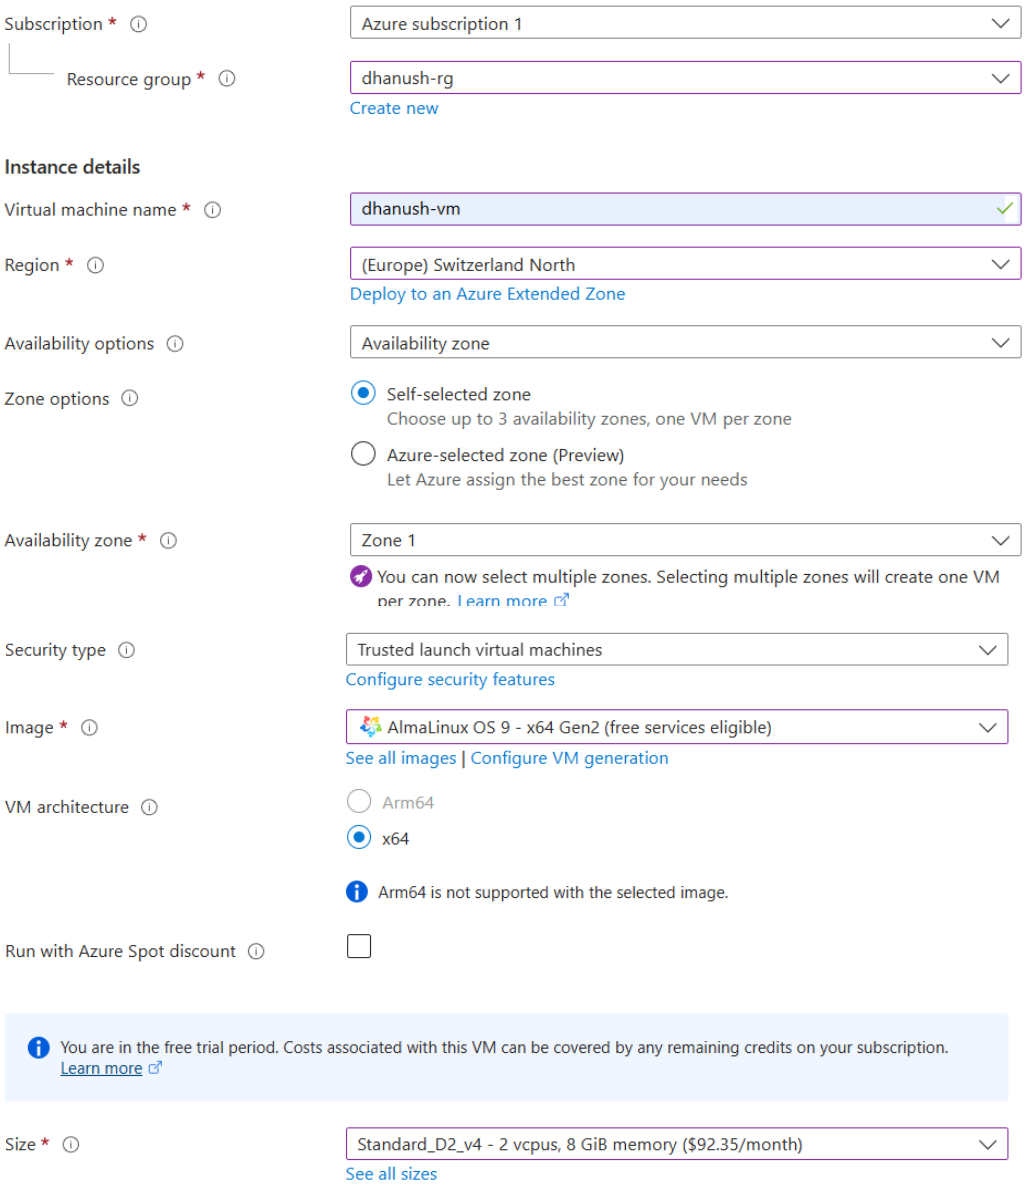

None

STEP 1: Create an Azure Linux VM

1. Go to **Azure Portal → Virtual machines → Create → Azure virtual machine**
2. Fill details:
   - **Resource group**: <studentname>-rg
   - **VM name**: <studentname>-linux-vm
   - **Region**: (Choose closest region)
   - **Image**: AlmaLinux 9 (x64 Gen2)
   - **Authentication type**: SSH public key → Generate new key pair
   - **Key name**: <studentname>-key
   - **Inbound ports**: Allow SSH (22)

Click **Review + Create → Create.**

Administrator account

Authentication type ⓘ

- (•) SSH public key
- ( ) Password

ⓘ Azure now automatically generates an SSH key pair for you and allows you to store it for future use. It is a fast, simple, and secure way to connect to your virtual machine.

Username * ⓘ: dhanushuser ✓

SSH public key source: Generate new key pair ⌄

SSH Key Type

- (•) RSA SSH Format
- ( ) Ed25519 SSH Format

ⓘ Ed25519 provides a fixed security level of no more than 128 bits for 256-bit key, while RSA could offer better security with keys longer than 3072 bits.

Key pair name *: dhanush-vm_key ✓

Inbound port rules

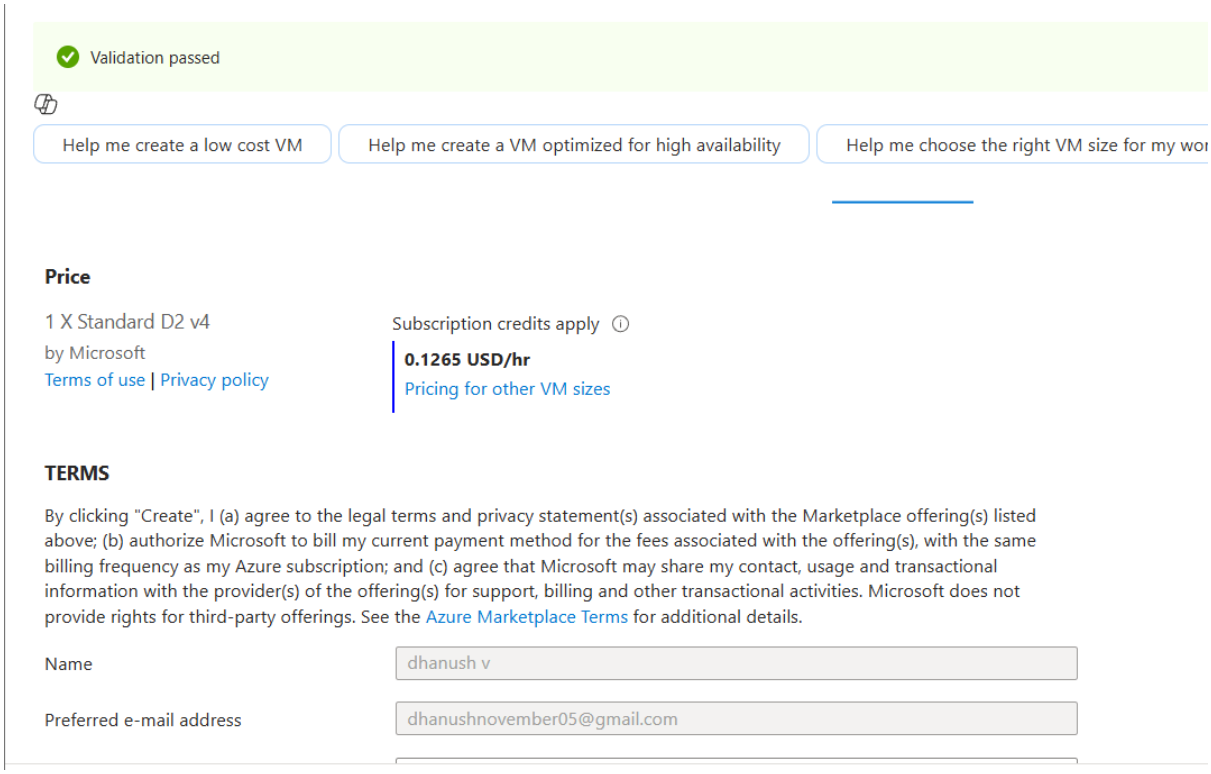

Select which virtual machine network ports are accessible from the public internet. You can specify more limited or granular network access on the Networking tab.

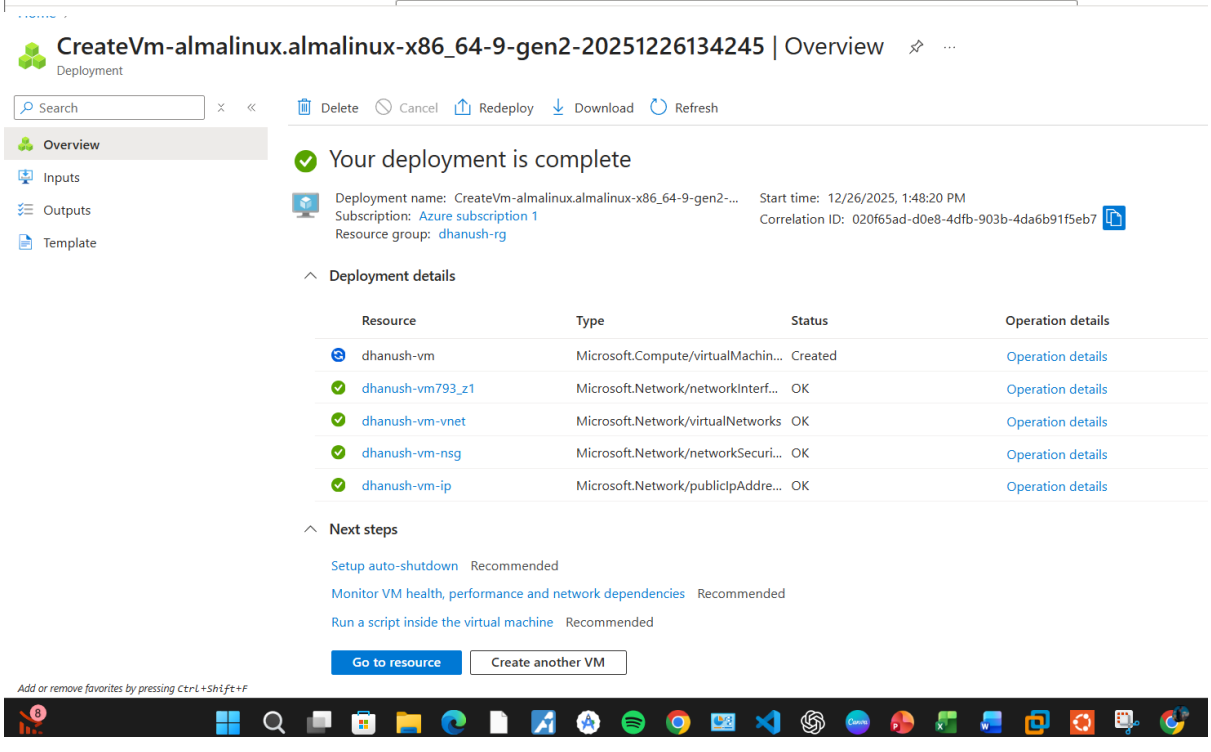

Public inbound ports * ⓘ

- ( ) None
- (•) Allow selected ports

Select inbound ports *: HTTP (80), SSH (22) ⌄

⚠ **This will allow all IP addresses to access your virtual machine.** This is only recommended for testing. Use the Advanced controls in the Networking tab to create rules to limit inbound traffic to known IP addresses.

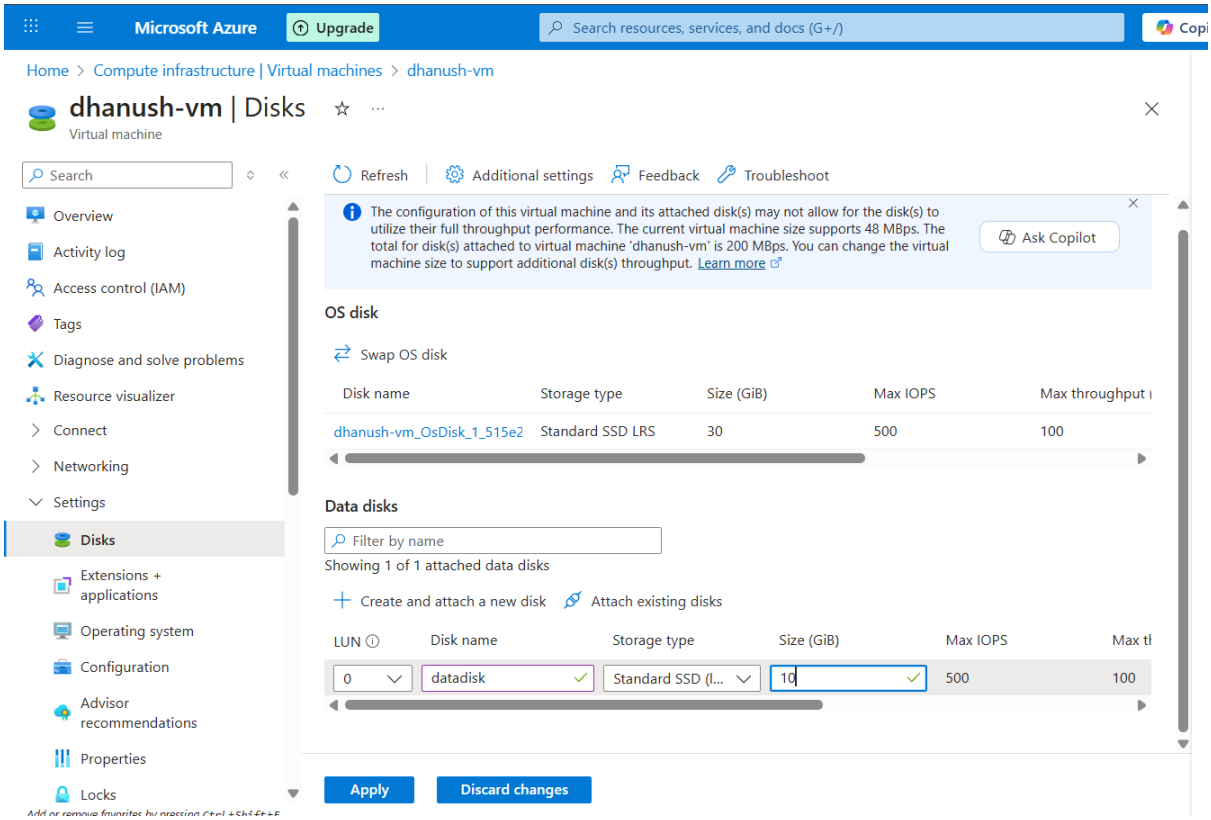

STEP 2: Take Snapshot of OS Disk

1. Go to your **VM** → **Disks**

2. Click on the **OS Disk** (e.g., studentname-linux-vm_OsDisk_1)
3. In the disk blade, click **Create snapshot**
4. Provide:
    - **Snapshot name**: studentname-osdisk-snap
    - **Resource group**: <studentname>-rg
    - **Storage type**: Standard HDD (or Premium if needed)
5. Click **Review + Create → Create**

Creating an data disk

After creating the datadisk

```
C:\Users\DHANUSH>ssh -i "C:\Users\DHANUSH\Downloads\dhanush-vm_key.pem" dhanushuser@51.103.216.243
The authenticity of host '51.103.216.243 (51.103.216.243)' can't be established.
ED25519 key fingerprint is SHA256:Eg7/BJ/PL0fGaCceDdE0LMBuYXfEtSbu6E/6f+lVh5E.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '51.103.216.243' (ED25519) to the list of known hosts.
[dhanushuser@dhanush-vm ~]$ sudo -i
[root@dhanush-vm ~]# yum install httpd wget net-tools zip -y

STEP 3: Corrupt OS Disk (Simulation)

⚠️ Don't try this on production. Just for lab. SSH into VM:

Example simulation of corruption

sudo rm -rf /boot/*

```
[root@dhanush-vm data]# cd
[root@dhanush-vm ~]# rm -rf /*
```

Cros the vm

```
rm: cannot remove '/proc/1461/statm': Operation not permitted
rm: cannot remove '/proc/1461/maps': Operation not permitted
rm: cannot remove '/proc/1461/numa_maps': Operation not permitted
rm: cannot remove '/proc/1461/mem': Operation not permitted
rm: cannot remove '/proc/1461/cwd': Operation not permitted
rm: cannot remove '/proc/1461/root': Operation not permitted
rm: cannot remove '/proc/1461/exe': Operation not permitted
rm: cannot remove '/proc/1461/mounts': Operation not permitted
rm: cannot remove '/proc/1461/mountinfo': Operation not permitted
rm: cannot remove '/proc/1461/mountstats': Operation not permitted
rm: cannot remove '/proc/1461/clear_refs': Operation not permitted
rm: cannot remove '/proc/1461/smaps': Operation not permitted
rm: cannot remove '/proc/1461/smaps_rollup': Operation not permitted
rm: cannot remove '/proc/1461/pagemap': Operation not permitted
rm: cannot remove '/proc/1461/attr/current': Permission denied
rm: cannot remove '/proc/1461/attr/prev': Permission denied
rm: cannot remove '/proc/1461/attr/exec': Permission denied
rm: cannot remove '/proc/1461/attr/fscreate': Permission denied
rm: cannot remove '/proc/1461/attr/keycreate': Permission denied
rm: cannot remove '/proc/1461/attr/sockcreate': Permission denied
rm: cannot remove '/proc/1461/wchan': Operation not permitted
rm: cannot remove '/proc/1461/stack': Operation not permitted
rm: cannot remove '/proc/1461/schedstat': Operation not permitted
rm: cannot remove '/proc/1461/cpuset': Operation not permitted
rm: cannot remove '/proc/1461/cgroup': Operation not permitted
rm: cannot remove '/proc/1461/cpu_resctrl_groups': Operation not permitted
rm: cannot remove '/proc/1461/oom_score': Operation not permitted
rm: cannot remove '/proc/1461/oom_adj': Operation not permitted
```

The command are not working

```
[root@dhanush-vm ~]# lsblk
-bash: /bin/lsblk: No such file or directory
[root@dhanush-vm ~]#
```

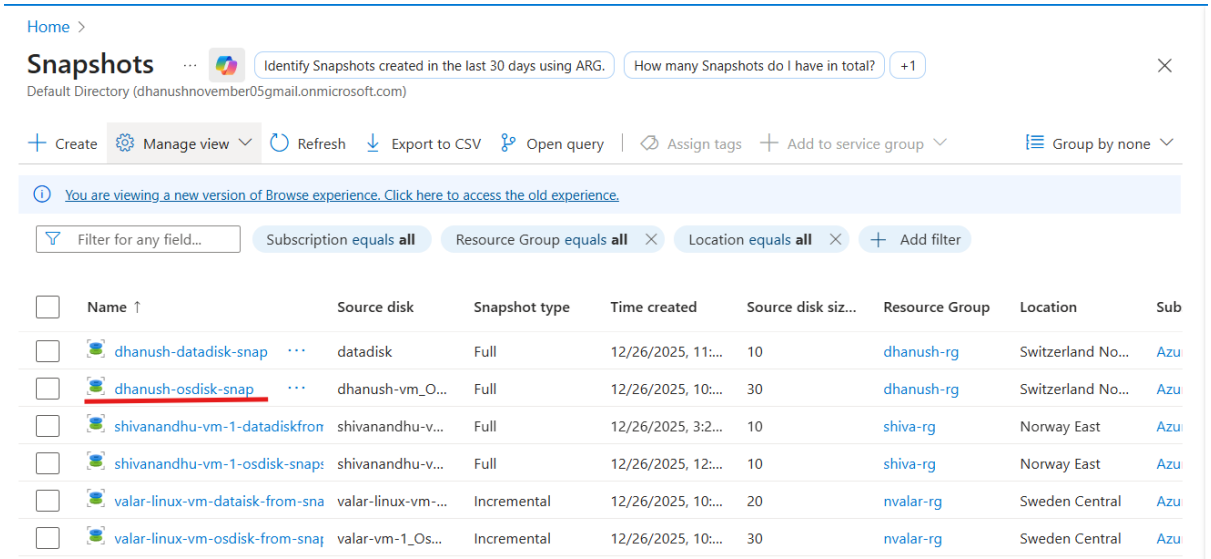

sudo shutdown -r now

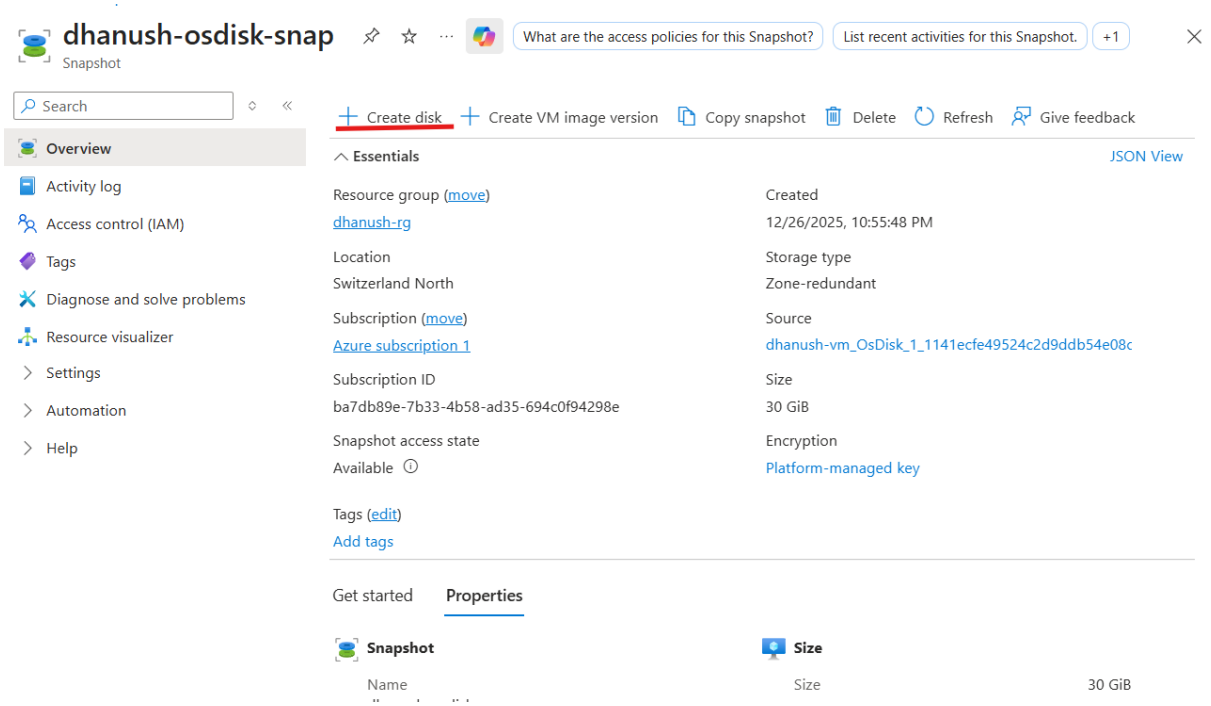

After reboot, VM will fail to boot.

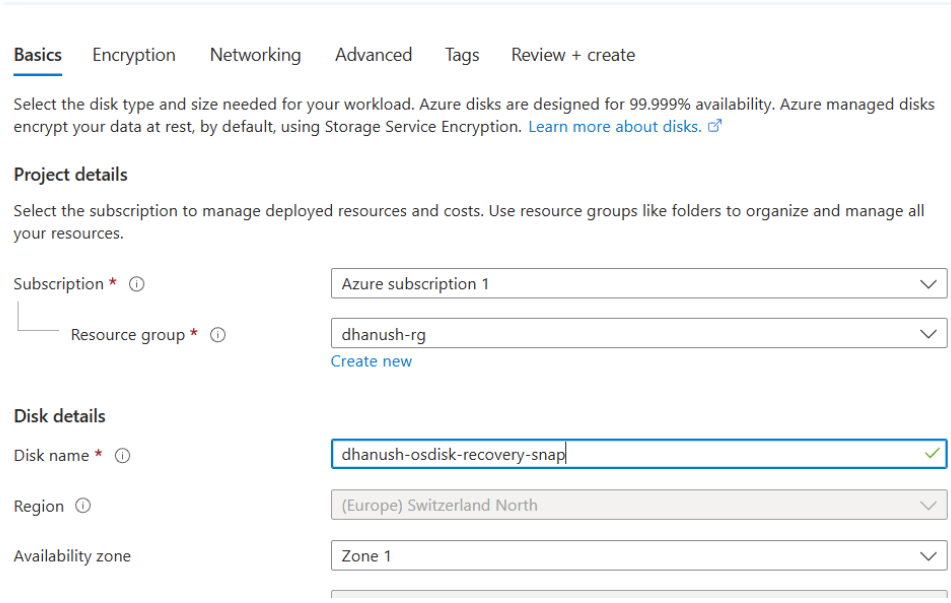

STEP 4: Create New OS Disk from Snapshot

1. Go to **Snapshots** → Select studentname-osdisk-snap
2. Click **Create disk**
3. Fill details:
    - **Disk name**: studentname-osdisk-recovery
    - **Resource group**: <studentname>-rg
    - **Disk type**: Standard HDD / SSD
    - **Source type**: Snapshot

4. Click **Review + Create → Create**

Create a managed disk ...

Basics Encryption **Networking** Advanced Tags Review + create

Enable access to your managed disk either publicly using public IP addresses or privately using private endpoints.

Network access
