LAB 9 : Azure NAT Gateway with AlmaLinux Private VM

🎯 Lab Goal

- Create VNet with Public & Private Subnets
- Deploy NAT Gateway for outbound internet on private subnet
- Deploy 2 AlmaLinux VMs → **Jumpbox (public)** + **Private VM (no public IP)**
- Test internet access from private VM using commands other than ping
- Understand **why ping doesn’t work with NAT Gateway**

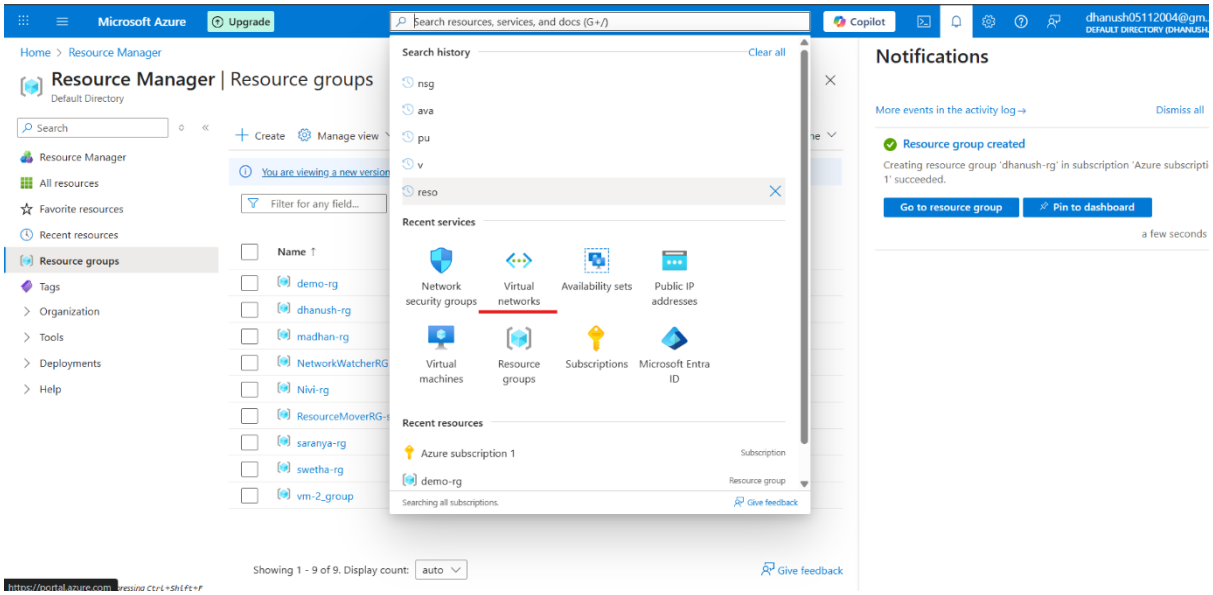

Step 1: Create Resource Group

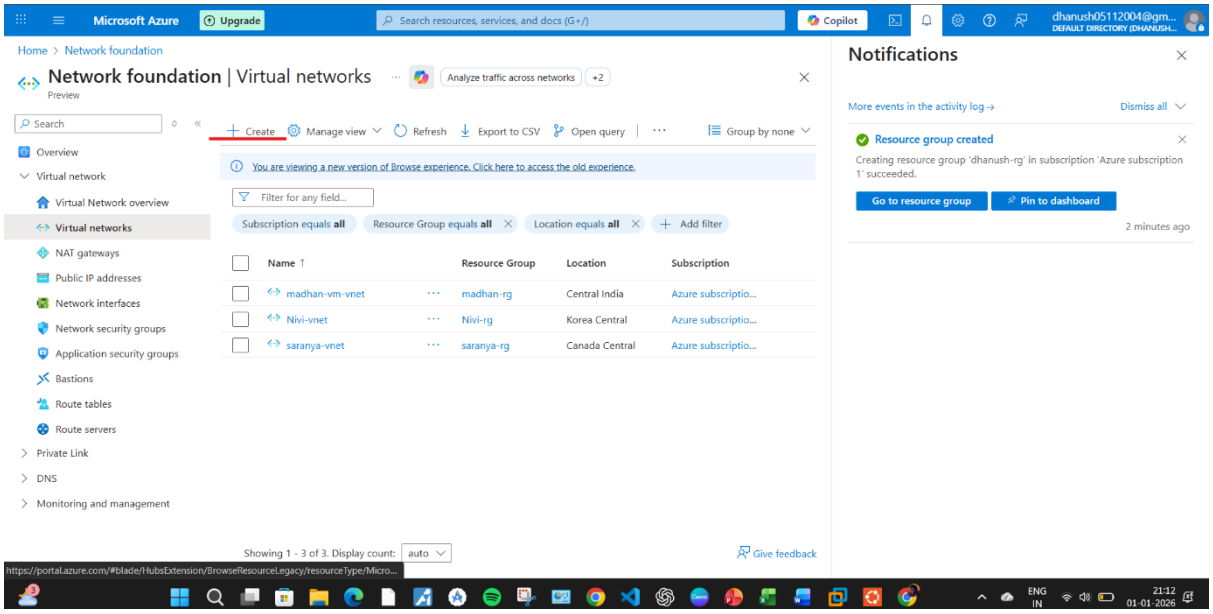

- Name: **studentname-rg**
- Region: East US (or your choice).

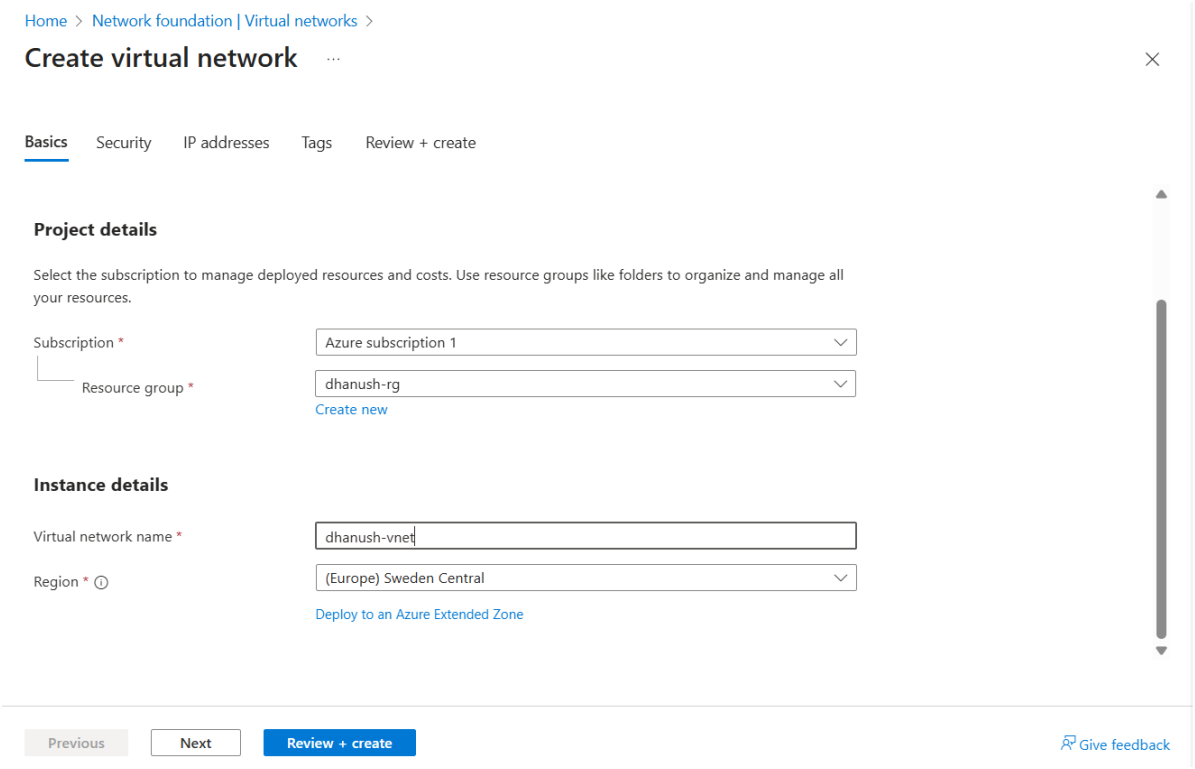

Step 2: Create Virtual Network

- Name: **studentname-vnet**
- Address space: 10.0.0.0/16

TERMS

By clicking "Create", I (a) agree to the legal terms and privacy statement(s) associated with the Marketplace offering(s) listed above; (b) authorize Microsoft to bill my current payment method for the fees associated with the offering(s), with the same billing frequency as my Azure subscription; and (c) agree that Microsoft may share my contact, usage and transactional information with the provider(s) of the offering(s) for support, billing and other transactional activities. Microsoft does not provide rights for third-party offerings. See the Azure Marketplace Terms for additional details.

Name: dhanush v

Preferred e-mail address: dhanush05112004@gmail.com

< Previous | Next > | Create

The selected subnet 'dhanush-public-subnet (10.0.1.0/24)' is already associated to a network security group 'dhanush-nsg'. We recommend managing connectivity to this virtual machine via the existing network security group instead of creating a new one here.

Configure network security group *: dhanush-nsg
Create new

Delete public IP and NIC when VM is deleted

Enable accelerated networking

Load balancing

You can place this virtual machine in the backend pool of an existing Azure load balancing solution. Learn more

Load balancing options

- None
- Azure load balancer
  Supports all TCP/UDP network traffic, port-forwarding, and outbound flows.
- Application gateway
  Web traffic load balancer for HTTP/HTTPS with URL-based routing, SSL termination, session persistence, and web application firewall.

Step 7 : Connect to VMs

Vm 1

Vm 2

Step 8: Test Internet Access on Private VM

Update packages (requires internet)

sudo dnf update -y

Install curl and wget

sudo dnf install -y curl wget

Check outbound public IP (should be NAT Gateway IP)

curl ifconfig.me

Test HTTPS connectivity

curl -I https://www.google.com

Download test file

wget http://speedtest.tele2.net/1MB.zip -O /dev/null

Test DNS resolution

dig google.com

Step 9: Verify in Azure

1. **Go to NAT Gateway → Metrics**

2. **Check SNAT connections and Data processed – traffic should appear from your private VM.**

❓ Why Ping Doesn’t Work with NAT Gateway

- **NAT Gateway supports only TCP & UDP outbound connections.**
- **ICMP (used by ping) is not translated by NAT Gateway.**
- **That’s why ping google.com fails, but curl/wget/dnf works fine.**
